

EUROSIX / Big 6 Colour Variances

Natural Grey

Eurosix Natural Grey Fibre Cement may show slight variations within the natural grey colour range of both Eurosix sheets and fittings. Different batches of cement and other raw materials may slightly vary in colour but all products are designed to blend and fade from the day they are installed.

Moisture content held within the laminations of Eurosix products may be seen to show darker patches especially on the underside of some sheets and fittings.

All Eurosix fittings are hand made and the production process is slightly different to the Eurosix sheets so natural grey shade variations between sheets and fittings can be expected, especially at the early stages of the roof installation, but will generally weather in and become a more consistent colour after a period of time on the roof.

Standard/Extended Colour Range

The Eurosix fibre cement standard and extended colour range provides a satin and smoother top surface compared to natural grey sheets and reduces the growth of moss on the top surface of Eurosix sheets and fittings after installation.

Eurosix hand made fittings could appear to vary slightly in colour, but this will be due to the manufacturing process, as the same paint will be used on both sheets and fittings.

Moisture content within the Eurosix laminations and various cement batches can also be the reason for colour variations.

Meadowscape

Meadowscape Eurosix colour variations are expected and detailed within the Meadowscape Data sheet which can be viewed on www.briarwoodproducts.co.uk

The Meadowscape colour range of sheets and fittings will fade from the day it is fixed, and is a matt surface finish. Meadowscape sheets and fittings will also vary in colour and shade but again, this is expected and designed to blend in to the countryside and landscape which may already include older agricultural buildings within it.

Moisture content held within the Meadowscape Eurosix laminations and different batches of cement used during the manufacturing process can also be a reason for natural colour variations seen.

*Generally, after a season or two fixed and weathered in on any roof, colour variations should reduce and blend in.
